A protein having insecticidal activity, a DNA encoding said protein, and an agent and a method for preventing harmful organisms.

Claim 1; Page 9-12; 19pp; Japanese.

This invention relates to a crystalline protein comprising a fully defined sequence and the nucleotide sequence encoding this protein. The defined sequence and the nucleotide sequence encoding this protein. The protein of the invention is an agent for preventing harmful organisms comprising Bacillus thuringiensis serovar galleriae SDS502, its mutant or a microbe transformed by a DNA encoding the protein. This microbe can be used to produce a protein containing the protein, or containing a protein can enact a microbe a microbe which is transformed by using the above transformed microbe, a microbe which is transformed by using the above on a seed transformed by using the above DNA, and Bacillus thuringiensis serovar galleriae SDS502 producing a protein comprising and producing a serovar galleriae SDS502 producing a protein comprising and producing a protein showing insecticidal activity. The protein of the invention may have insecticidal activity. The agent is used for preventing Coleoptera larvae. This sequence represents the Bacillus thuringiensis insecticide contains and producing a protein of the invention

Sequence 1167 AA;

```
Gene sequences encoding a toxin which is active against acarides and is obtainable from B. thuringiensis isolates PS17a, PS17b, 33f2, PS52A1, PS69D1, PS8AA1 and PS50C are given in AAQ10803-07 and AAQ10802-21 respectively. The toxin is a delta-endotoxin active against acarid pests, including the Two Spotted Spider mite. The isolates can be used against non-phytophagus mites such as acarid pests of livestock, fowl and stored prods. The genes can be cloned and used to transform other hosts, which can be used to control mites, or in the case of transgenic plants, be resistant to mites. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ETFISSSTVQTGIGIVGQVLGALGVPFAGQIASPYSFIVGQL#PSSTVSVWEMIMKQVBD 120

The sequence given is an approx. 130 kD protien known as Bacillus thuringiensis PSSOC (B.t.PSSOC). This novel delta-endotoxin has been shown to be active against the Colorado potato beetle (Leptinotarsa decemlineata). The gene encoding this toxin can be transformed into suitable hosts such as Pseudomonas, which can then be applied to the environment of coleopteran insects where they will proliferate and be ingested by the insects. This DNA sequence can be inserted into an expression vector which contains a promoter/operator region, a ribosome binding site, polyadenylation signals, etc. This will allow transcription and translation of the cells in the appropriate host. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ETFISSSTVOTGIGIVGOVIGALGVPFAGQIASFYSFIVGQLWPSSTVSVWEMIMKQVED 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 419
The sequences given in AAR33768-70 represent lepidopteran-active toxins. The DNA encoding these sequences were used within a Ti or Ri plasmid, to transform plant cells. Whole plants can then be regenerated from the transformed cells. The toxin may also be produced by cloning Bacillus thuringiensis (Bt) . It may then be applied directly to the plant locus (Updated on 25-WAR-2003 to correct PN field.) (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LANYYAQVYGVPYASFTLLDKNTGSGSVGGFTYSKPHTMQVCTQNYNTIDEIPPENB-P 478

Bacillus thuringiensis; strain kumamotoensis

US5554534-A 10-SBP-1996 94US-00315468.

30-SEP-1994;

```
The DNA encoding this sequence was isolated from the Bacillus

The DNA encoding this sequence was isolated from the Bacillus

Continuinglensis strain kumamotoensis. Insects in the family Scarabaeidae

constitute a serious pest control problem, especially when destructive

constitute a serious pest control problem, especially when destructive

constitutes a serious pest control problem, especially when destructive

clarval stage insects infest high value turf found in golf courses,

playing fields and lawns. The larvae of many species also attack grains,

cherous crops, and onnamentals. The larvae are known as white grubs, or

chafter grubs, and conmamentals. The larvae and the U.S. populations of

where they consume plant roots. In Burope and the U.S. populations of

these larvae and adults have developed resistance to chemical

insecticides such as the organochlorines and DDT. These toxin sequences,

and intact cells that are capable of expressing these proteins, can be

used to control many pests of the family scarabaeidae, such as species of

yclocephala, and Popillia. The toxins are active against larvae (present

in soil) and against adults. (Updated on 16-OCT-2003 to standardise OS

field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    300

The toxin is a delta-endotoxin which has a mol. wt. of ca. 130 kD. It is useful for control of coleoptera larvae e.g. it is effective against Anomala cuprea but has little effect on Lepidoptera. The toxin can be used as B.t. spores or crystals, as opt. treated cells (B.t. or transformed microorganisms) or it is expressed by plants. (Updated on 25-MAR-2003 to correct PN field.) The invention is useful for impacting an insect pest by applying the the molecules of the invention to the environment of the insect pest by spraying, dusting, broadcasting, or seed coating, where the insect pest is selected from Colorado potato beetle, western corn rootworm or southern corn rootworm or for invention is also useful for increasing insect target range and for producing transgemic microorganisms and plants that express the pesticidal polypeptide. The invention is also to produce the pesticidal polypeptide of the invention is also to produce the pesticidal polypeptide of the invention is also acid sequence represents a Bacillus thuringiensis wild-type Cryl218

                                                                                                                                                                                                                                                                                                                                                                                                     invention is useful for impacting an insect pest by applying the the molecules of the invention to the environment of the insect pest by spraying, dusting, broadcasting, or seed coating, where the insect pest is selected from Colorado potato beetle, western corn rootworm or southern corn rootworm. The invention is also useful for increasing insect target range and for producing transgenic microorganisms and plants that express the pesticidal polypeptide. The invention is also useful for producing transformed plants and in transforming any organism to produce the pesticidal polypeptide of the invention. The present amino acid sequence represents a Bacillus thuringiensis wild-type Cryl218

The DNA encoding this sequence was isolated from the Bacillus
The DNA encoding this sequence was isolated from the Bacillus
Thuringiensis strain kumamotoensis. Insects in the family Scarabaeidae
Constitute a serious pest control problem, especially when destructive
larval stage insects infest high value turf found in golf courses,
playing fields and lawns. The larvae of many species also attack grains,
tuberous crops, and ornamentals. The larvae are known as white grubs, or
chafer grubs, and can be found in decaying organic matter, or in the soil
where they consume plant roots. In Burope and the U.S. populations of
these larvae and adults have developed resistance to chemical neguences,
insecticides such as the organochlorines and DDT. These toxin sequences,
and intact cells that are capable of expressing these proteins, can be
cused to control many pests of the family scarabaeidae, such as species of
cyclocephala, and Popillia. The toxins are active against larvae (present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240

                                                                                                                                                                                                                                                                                                                                            This is the amino acid sequence of a Cry9C (crystal) mutant protein which is toxic to an insect species. It is modified in the method of the invention in an attempt to improve its toxicity. The improved proteins are useful for producing transgenic plants and seeds in controlling insects feeding on a plant. The transgenic plants are also useful for producing transgenic plants with similar characteristics, or for introducing the improved cry9C gene (including fragments) into the same plant variety or related plant species. The Cry9C protein can be obtained from cultured cells of the transgenic plants and used in insecticide compositions against lepidopteran insects. especially Ostrinia mubilalis, Heliothis virescens and Diatraea grandiosella. The cry9C gene can be expressed in combination with another insect control protein (e.g. Another B. thuringiensis derived crystal protein especially Cry1Ab or Cry1B-type protein), and used to transform B.thuringiensis, which crystalery of insect pests, or insects where insect resistance development is prevented or delayed. (Note: this sequence is not given in the second or protein in the sequence is not given in the second or secon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    119

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of a Cry9C (crystal) mutant protein which is toxic to an insect species. It is modified in the method of the invention in an attempt to improve its toxicity. The improved proteins are useful for producing transgenic plants and seeds in controlling are useful for producing transgenic plants and seeds in controlling insects feeding on a plant. The transgenic plants are also useful for producing more transgenic plants with similar characteristics, or for introducing the improved cry9C gene (including fragments) into the same plant variety or related plant species. The Cry9C protein can be obtained from cultured cells of the transgenic plants and used in insecticide compositions against lepidopteran insects, especially Ostrinia nubilalis, Hellothis virescens and Diatraea grandiosella. The cry9C gene can be expressed in combination with another insect control protein (e.g. Another B thuringiensis derived crystal protein, especially Cry1Ab or Cry1B-type protein), and used to transform B thuringiensis, which cry1B-type protein), and used to transform B thuringiensis, which carriety of insect pests, or insects where insect resistance development is specification, but is generated using the information provided by the

This is the amino acid sequence of a Cry9C (crystal) mutant protein which is toxic to an insect species. It is modified in the method of the invention in an attempt to improve its toxicity. The improved proteins are useful for producing transgenic plants and seeds in controlling insects feeding on a plant. The transgenic plants are also useful for producing more transgenic plants with similar characteristics, or for introducing the improved cry9C gene (including fragments) into the same plant variety or related plant species. The Cry9C protein can be obtained from cultured cells of the transgenic plants and used in insecticide compositions against lepidopteran insects, especially Ostrinia mubilalis, Heliothis virescens and Diatraea grandiosella. The cry9C gene can be expressed in combination with another insect control protein (e.g. crypsessed in combination with another insect control protein (e.g. cry1B-type protein), and used to transform B.thuringiensis, which produces other insecticidal toxins. Such strains are useful against a produces other insecticidal toxins. Such strains are useful against a variety of insect pests, or insects where insect resistance development is prevented or delayed. (Noce: this sequence is not given in the second or delayed. (Noce: this sequence is not given in the constinct in the second or delayed in the information provided by the
                                                                                                                                                                                                              New Bacillus thuringiensis Cry9C crystal proteins with improved toxicity - useful for producing transgenic plants in controlling pest insects, especially Ostrinia nubilalis, Heliothis virescens and Diatraea grandiosella.
